

MinnFinn

The Revolutionary, New, Safe and Biodegradable Treatment for your *Koi and Goldfish*

What does **MinnFinn** treat?

MinnFinn excels at treating a number of organisms found on the outside of your fish. **MinnFinn** eliminates **PROTOZOA** parasites, **FLUKES** and many external **BACTERIAL** infections. **MinnFinn** has effectively eliminated protozoa infections, fluke infections, red sores on fish and bacterial gill infections.

How many treatments of **MinnFinn** are needed?

MinnFinn can eliminate most **PROTOZA** infections in **ONE** treatment (i.e. Costia and Trichodina). Cases of **ICH** will require three treatments with one day between treatments. Bacterial Gill Disease was effectively treated in one treatment and Red Sores cleared up in one to two. Flukes were cleared in one to three treatments (applied as for Ich) depending on the species of fluke.

“ I tested the pond in two days and the scraping showed they were clear of any skin flukes or parasites. Note the neutralizer killed all the algae on the areas where it first hit in the water and still has not come back in two weeks

Thanks for all your assistance, in the above matter.. Brian Liljas”

Are water changes needed?

MinnFinn does not require water changes if application instructions are followed, making it very simple and safe to use.

How do you stop a **MinnFinn** treatment?

MinnFinn is fully neutralizable so the treatment is ended immediately with the application of **NeuFinn**. Once neutralized it is like the treatment was never there.

Is **MinnFinn** harmful to the environment?

No, **MinnFinn** is EPA registered for safe discharge directly into open water bodies. **MinnFinn** is the most effective yet environmentally benign therapy on the market today.

How does **MinnFinn** compare to formalin and malachite green?

Not only is **MinnFinn** much more effective on a wider variety of pathogens, it is also non-toxic and not persistent in the environment as Formalin and Malachite Green are.

Is **MinnFinn** dangerous to the user like formalin and malachite green?

No. **MinnFinn** is non toxic and safe to use. While it has a strong smell and you need to avoid direct contact, there are no long term affects like formalin and malachite green. Both formalin and malachite green are both cancer-causing and can create severe long and short term health problems to the applicator.

How does **MinnFinn** compare to praziquantel?

MinnFinn is as effective against flukes as praziquantel while controlling other pathogens that might be present. **MinnFinn** is also cheaper to apply and has no negative environmental impacts.

What is the shelf life of **MinnFinn**?

MinnFinn should be stored in a cool place out of direct sunlight. With proper storage the shelf life is 1 year.

When can you treat with **MinnFinn** and with what?

MinnFinn can be used throughout the year and has shown to be compatible with fish in water containing salt. Like all therapies, it is not recommended for use in combination with ANY other treatments.

MinnFinn is manufactured completely in the USA
in accordance with ISO 9001.

*"Hi Paul,
Sorry I haven't gotten
back to you sooner.
We had some small long
fin come in on Feb. 26.
They were very weak...*

*On March 9, I did some
scrapes on them and
noticed they had
Saprolegnia and
Chilodonella. I then
treated with MinnFinn
Max.
March 10, I tested the
water for Ammonia, there
was none. I do have a
large filter on that
quarantine tank. Also did
scrapes on 2 more fish.
No evidence of
Chilodonella or
Saprolegnia....*

*March 16, I did scrapes
on 4 fish, found nothing
and also tested the water
(for ammonia), it was
fine.
We have not lost
anymore and they are
doing great.
I only treated once with
MinnFinn Max.
I am very impressed with
your product MinnFinn
Max.*

*Thank you
Clint Smith*
